5	**Table Z**	Commutation Factors	689
6	**Table 90CM**	Mortality Table	789

USE OF TABLES

The factors set forth in this publication involving life contingencies are derived from the values of l_x taken from the Life Table for the Total Population appearing as Table 1, in "U.S. Decennial Life Tables for 1989-1991" published by the U.S. Department of Health and Human Services, Public Health Service, National Center for Health Statistics. Table 1 appears in this publication in Section 6, labeled as Table 90CM.

These factors are for the computation of interests in unitrusts. A unitrust is a trust wherein the trustee is directed to pay annually a fixed percentage of the fair market value of the trust computed each year, either for a life or lives or for a term of years, or for a combination of lives and years. The fixed percentage is called the payout rate. If the payments are made other than annually at the beginning of each year, the payout rate must be adjusted (using Table F) in order to compute the unitrust interest involved.

The factors in Sections 1 through 3 and Section 5 are based on adjusted payout rates ranging from 2.2 percent to 22.0 percent in intervals of 0.2 percent.

Table U(1), Section 1, contains factors for the present worth of the remainder interest in a single life unitrust.

Table U(2), Section 2, contains factors for the present worth of the remainder interest in $1.00 payable at the death of the last to die of two persons.

Table D, Section 3, contains factors for the present worth of a remainder interest for a term certain.

Table F, Section 4, contains factors for computing adjusted payout rates for annual, semiannual, quarterly, and weekly payment periods at interest rates from 2.2 percent to 22.0 percent.

Table Z, Section 5, contains commutation tables for ${}^{U}D_x$, ${}^{U}N_x^{O}$, and ${}^{U}\overline{M}_x$, for computing the retained interest in a unitrust payable for the shorter of one life or a term of years.

Table 90CM, Section 6, is the underlying mortality table used to calculate factors involving life contingencies.

All of the factors in this publication reflect annual compounding of interest.

EXAMPLES

For the following examples, we assume that the unitrust pays out 7.0 percent per year in equal quarterly installments at the end of each quarter. In addition, we assume that the unitrust interest involved is valued at the section 7520 interest rate of 8.0 percent. Based on these facts, the adjusted payout rate is 6.673 percent, determined as follows:

Applicable Interest Rate	=	8.0 %
Quarterly Payout Adjustment Factor Table F(8.0)	=	.953258

(First payment made at least 3 months but less than 4 months from annual valuation)

Annual Payout Percentage	=	7.0 %
Adjusted Payout Rate	=	7.0 % x 0.953258
	=	6.673 %

A. Two Life Last-to-Die Factors

Example 1. On the first day of the year, a person who is nearest to age 65 contributes $500,000 to a charitable remainder unitrust. The trust pays to him 7 percent per year of the annually computed value of the trust assets, paid in equal quarterly installments at the end of each quarter. After his death the trust makes the same payments to his wife (nearest to age 60) if she is then living, for such time as she survives him.

Under section 7520 of the Internal Revenue Code, if a charitable deduction is allowed for a transfer of property to the trust, the taxpayer may elect to use either the section 7520 rate for the month of transfer or the rate for either of the two preceding months. We assume the taxpayer elects to use the rate of the month of transfer, 8.0 percent.

Remainder Factor, Table U(2), at 6.6 %	=	0.21494
minus Remainder Factor, Table U(2), at 6.8 %	=	0.20582
Difference	=	0.00912

$$\frac{6.673\ \% - 6.600\ \%}{6.800\ \% - 6.600\ \%} = \frac{X}{0.00912}$$

$$X = 0.00333$$

Remainder factor at 6.6 %	=	0.21494
minus X	=	0.00333
Required Interpolated Remainder Factor at 6.673 %	=	0.21161
times Initial Trust Corpus Value	=	$500,000.00
Present Value of Remainder Interest	=	$105,805.00

B. Factors Involving One Life and a Term of Years

Example 2. On July 1st, a person transfers $300,000 to a Grantor's Retained Unitrust which pays 7.0 percent per year in equal quarterly installments at the end of each quarter for 10 years or until the prior death of the grantor, who is nearest to age 60. The section 7520 interest rate for July is 8.0 percent. In order to determine the present value of the grantor's retained interest in the trust, it will be necessary to perform two computations and interpolate between the two results. The present value of the retained interest in the trust is $142,872.00 determined as follows:

First Computation: Payout Rate = 6.6 %

$$\text{Equivalent Interest Rate Factor at 6.6 \% Payout Rate} = \frac{6.6\ \%}{1 - 6.6\ \%} = 0.07066$$

	Initial age	= 60
plus	Term of years	= 10
	Terminal age	= 70

${}^{O}_{U}N_{60}$, Table Z (6.6)	= 18984.20
minus ${}^{O}_{U}N_{70}$, Table Z (6.6)	= 6633.186
Difference	= 12351.014
${}^{U}D_{60}$, Table H(6.6)	= 1848.048
Payout Interest Factor at 6.6 %	= 12351.014 ÷ 1848.048
	= 6.68315
times Equivalent Interest Rate Factor at 6.6 %	= 0.07066
First Payout Interest Factor, at 6.6 %	= 0.47223

Second Computation: Payout Rate = 6.8 %

Using the same method as above, compute:

Second Payout Interest Factor, at 6.8 % = 0.48321

Using the interpolation method shown in example 1, interpolate between the Second Payout Interest Factor of 0.48321 and the First Payout Interest Factor of 0.47223:

Required Interpolated Payout Interest Factor at 6.673 %	= 0.47624
times Initial Trust Corpus Value	= $300,000.00
Present Value of Grantor's Retained Interest	= $142,872.00

Table U(1) - Based on Life Table 90CM
